UnconnectedBroadcastInterval

The **UnconnectedBroadcastInterval** configuration item specifies the interval at which connections will be established to non-permanent neighbors.

Units:	milliseconds
Minimum Value:	60000
Maximum Value:	4294967295
Default Value:	900000 (15 minutes)
Dynamic:	Yes

Constraints

Remarks

The **UnconnectedBroadcastInterval** configuration item specifies the interval at which connections will be established to non-permanent neighbors, provided that the current marker of the message server differs from the last marker received from the neighbor (this check ensures that the connection will only be established when there is synchronization that needs to occur with the neighbor).

Note that currently the same interval is applied to all non-permanent neighbors. This may change in a future release to allow a finer degree of tuning.
