

Project Tasks & Milestones

The aim of the project Tasks process is to develop and maintain an accurate plan of all the tasks a project needs to complete, their start & end dates along with an understanding of dependencies (internal and external) that can be shared.

The application we use to maintain this information is ServiceNow. Minimum information on milestones and inter-project dependencies MUST be maintained in SNow.

Dependencies should be actively managed between projects. To link one plan to another in SNow each project must provide access to the other via the Access field.
