Document Title: Group Definitions for the Secure NT Build

Document Type: Requirement Definition

Abstract: The ACP requires that access to Pathway systems be

controlled by the use of pre defined roles to which users can be assigned. Such roles will allow users to access only those parts of the system, with associated objects, they need in order to complete the tasks associated with that particular role. This document summarises this requirement and defines the roles, with associated objects, domains and access requirements.

Status: Approved

Local Access via the console attached directly to an NT platform

0.5 Changes in this version

Changes made to Scope and Appendix A.

0.6 Changes Forecast

Clarification of roles used to administer the MIS is being sought. One or more new roles may be identified to replace the MIS BPS User role which is being removed. Any new roles identified will be introduced as a result of a CP.

Introduction

The nature of the Pathway system requires that access to the core systems should be strictly controlled. [ACP] states that effective control depends on having a clear definition of the roles and responsibilities of all personnel who need some form of access to the system. Users will gain access by being assigned to these roles. This will be core to Pathway implementing the principles of least privilege.

This document summarises the requirement and defines the human roles that will be implemented for NT platforms; which objects will be used by each role; the domains each role will function within; access point for the role; and associated privileges.

2. Scope

This document addresses the roles to be implemented as part of the Pathway central NT systems and access rights assigned to each role. Each role within this document access the datacentre through the Pathway NT Domain Structure referenced in [NT DOM]. With regard to roles accessing systems in the Rollout Database domain, FRODB, all roles described here will apply to all systems described in [NT DOM]. Roles described in this document will not apply to the RODB Replication Server, which is not a member of the FRODB domain.

Roles used by SMC, SMG and Girobank are specifically excluded from this document as they authenticated on separate NT systems which form part of a managed service. Roles used and defined by OSD are described in this document for completeness. Configuration of these roles in the live estate may be partly provided by SDU and T&I PIT or completely by OSD.

3. Requirements

The requirement to implement a role based access control system emanates from [ACP]. [ACP] further defines the roles that are required for access to the Pathway Systems and the responsibilities of these roles.

It should be noted that the Pathway solution has moved on since Version 2 of the ACP was issued and, as such, the Groups defined at Appendix A do not always correlate with the roles defined in [ACP]. This will be addressed by feeding these role definitions into the current review of the ACP which will be subject to a CP once all necessary changes have been agreed.

4. Implementation

Each role will be set up as a Group within NT. Individual users will be assigned to these Groups in which access to objects, domains, servers and associated privileges will be controlled. These Groups are defined in Appendix A.

Roles will have defined access points which will have an accompanying Platform Design Document. Access to objects will be made available to each role at the relevant access

Ref: RS/REQ/016 Version: 1.0 Date: 4/11/99

Commercial In Confidence

point. This document specifically covers the Groups accessing the data centres. The Horizon Helpdesk and SMC/SMG roles are the responsibility of the appropriate managed service for the provision of suitable client systems compliant to the SFS and ACP.

The definition of the users will be held in a spreadsheet, or similar, and automated tools will be used for the production of the relevant command scripts.

Human roles and service users, as defined in this document, will be implemented using automated command scripts. By doing this, it will simplify the implementation and maintenance of the roles and service users defined in Annex A and B. Exceptions to this are those roles within the support services, ICL Outsourcing and SSC, who will also access toolsets via the command line. All roles only have authority to access the toolsets specified in this document.

Human users created from the defined roles may only be members of one role/Group definition. This is required to ensure the user is only provided with one appropriate toolset.

Implementation of the toolsets for the ICL Outsourcing roles will be the responsibility of the managed service and profiles will be set up locally on the NT client. In these instances there will be no user profile on the PDC.

Implementation of the menu structure for each Group will ensure that users assigned to that Group will be able to access the application set necessary for them to fulfil their duties. Not all tools will be available through a direct menu option; for example, Business Objects Universes will be accessed via a Business Object menu option. The Business Objects Administrator will be responsible for allocating the appropriate universes to users. Those 'tools' prefixed with '>' will not typically be assigned as a menu option through the PDC.

4.1 NT Administrator User

The Windows NT operating system is provided with a super user known as the 'Administrator'. This user has full administration and configuration privileges which is exercised at both system/server and domain level. This capability cannot be removed from Windows NT. Pathway recognises the power that this user has and the ability that a human user, using the administrator user, has to interfere with the day to day operation of the Pathway solution.

To address this issue, Pathway will limit and restrict the use of the NT Administrator User. This will be achieved by:

- Renaming the Administrator User on all NT Servers so that it is hidden from the system. The account name and password will be specified by the Pathway Security Manager, which will be strictly controlled and stored in a secure safe.
- ➤ Restrict full administrator privileges to the 'Operational Management' role. Use of this role will be subject to the management and procedural controls set out in the 'Pathway Code of Practice', PA/STD/010.

Ref: RS/REQ/016 Version: 1.0 Date: 4/11/99

Commercial In Confidence

5. Notes that apply to Annex A

Those 'tools' prefixed with '>' will not be assigned as a menu option from the users workstation/access point. Instead the tool will be made available to the user from the Command Line.

The term NT Resource Kit will mean the full complement of NT Resource Kit utilities will be made available to the user role.

The term NT Resource Kit* {Toolname} will mean only the specific Resource Kit utility or utilities specified by {Toolname} will be made available to the user role.

The term NT Server Tools will mean the default Administrative Tools (Common) executables delivered with the NT Operating System.
