David,

Thanks for that. I'd pretty well confirmed that through Richard Brunskill yesterday afternoon.

Cheers,

Jan

Subject: our discussion today

Jan,

I've spoken to James Stinchcombe on the topic we discussed we spoke about today. It is the case that transactions held on the session stack but not committed are held in memory only and not written to the message store until the session is settled.

So any reboots that took place during a session would have wiped all EPOSS transactions. APS, NBS and ETU all create recovery records which are checked at reboot. Some of these are automatically recovered (and marked as such within message store). Others will request the clerk to confirm that the transaction was completed at which point they are committed or deleted.

Hope this helps.

Regards,

Dave Cooke
